# Hashing

---

Hash tables are used for keeping values with a key.

Just imagine a locker. You can only open them if you have the keys.

# Hashing

---

Assume you have a hash table named **Users** wherein username is used as key and the value is the name. It will be like this:

*1st record in Hash Table*

Key: jsmith

Value: John Smith

*2nd record in Hash Table*

Key: jdoe

Value: Jane Doe

# Properties of Hash Function

---

## Property 1: Deterministic

No matter how many times you parse through a particular input through a hash function you will always get the same result.

## Property 2: Quick Computation

The hash function should be capable of returning the hash of an input quickly. If the process isn't fast enough then the system simply won't be efficient.

# Properties of Hash Function

---

## Property 3: Pre-Image Resistance

What pre-image resistance states is that given  $H(A)$  it is infeasible to determine  $A$ , where  $A$  is the input and  $H(A)$  is the output hash.

## Property 4: Small Changes In Input Changes the Hash

Even if you make a small change in your input, the changes that will be reflected in the hash will be huge.

# Properties of Hash Function

---

## Property 5: Collision Resistant

Given two different inputs A and B where  $H(A)$  and  $H(B)$  are their respective hashes, it is infeasible for  $H(A)$  to be equal to  $H(B)$ .

## Property 6: Puzzle Friendly

It should be difficult to select an input that provides a pre-defined output. Thus, the input should be selected from a distribution that's as wide as possible.

# Hashing

---

Consider inserting the keys

10, 22, 31, 4, 15, 28, 17, 88, and 59

into a hash table of length  $m=11$  using open addressing with the primary hash function  $h(k) = k \bmod m$ . Illustrate the result of inserting these keys using collision avoidance through linear probing. What is the resultant hash table?

# Hashing

---

0	22
1	88
2	
3	
4	4
5	15
6	28
7	17
8	59
9	31
10	10

# Hashing (Linear Probing)

---

Consider inserting the keys

12, 18, 13, 2, 3, 23, 5 and 15

into a hash table of length  $m=10$  using open addressing with the primary hash function  $h(k) = k \bmod m$ . Illustrate the result of inserting these keys using collision avoidance through linear probing.

# Hashing (Quadratic Probing)

---

*let  $\text{hash}(x)$  be the slot index computed using hash function.*

*If slot  $\text{hash}(x) \% S$  is full, then we try  $(\text{hash}(x) + 1*1) \% S$*

*If  $(\text{hash}(x) + 1*1) \% S$  is also full, then we try  $(\text{hash}(x) + 2*2) \% S$*

*If  $(\text{hash}(x) + 2*2) \% S$  is also full, then we try  $(\text{hash}(x) + 3*3) \% S$*

# Hashing (Quadratic Probing)

**Example:** Let us consider table Size = 7, hash function as  $\text{Hash}(x) = x \% 7$  and collision resolution strategy to be  $f(i) = i^2$ . Insert = 22, 30, and 50.

Slot
0
1 <b>22</b> $\leftarrow 1+0$
2 <b>30</b> $\leftarrow 1+1^2$
3
4
5 <b>50</b> $\leftarrow 1+2^2$
6

# Hashing (Double Hashing)

---

let  $\text{hash}(x)$  be the slot index computed using hash function.

If slot  $\text{hash}(x) \% S$  is full, then we try  $(\text{hash}(x) + 1 * \text{hash2}(x)) \% S$

If  $(\text{hash}(x) + 1 * \text{hash2}(x)) \% S$  is also full, then we try  $(\text{hash}(x) + 2 * \text{hash2}(x)) \% S$

If  $(\text{hash}(x) + 2 * \text{hash2}(x)) \% S$  is also full, then we try  $(\text{hash}(x) + 3 * \text{hash2}(x)) \% S$

# Hashing (Double Hashing)

**Example:** Insert the keys 27, 43, 692, 72 into the Hash Table of size 7. where first hash-function is  $h1(k) = k \bmod 7$  and second hash-function is  $h2(k) = 1 + (k \bmod 5)$

Slot
0
1 <b>43</b>
2 <b>692</b>
3
4
5 <b>72</b>
6 <b>27</b>

The next key is **72** which is mapped to **slot 2** ( $72 \% 7 = 2$ ), but location **2** is already occupied.  
Using double hashing,

$$\begin{aligned} h_{\text{new}} &= [h1(72) + i * (h2(72))] \% 7 \\ &= [2 + 1 * (1 + 72 \% 5)] \% 7 \\ &= 5 \% 7 \\ &= 5, \end{aligned}$$

Now, as **5** is an empty slot, so we can insert **72** into **5th slot**.

Thank You!

A large, colorful brushstroke underline consisting of several parallel lines in shades of blue, purple, pink, red, orange, and yellow, extending horizontally across the text.
